

DevOps Deployment Task

This repository contains instructions and configurations for deploying a web application using modern DevOps practices and tools including Docker, Kubernetes (EKS), AWS, and Terraform.

Table of Contents

- [Prerequisites](#)
- [Deployment Steps](#)
 - [Step 1: Clone Repository](#)
 - [Step 2: Docker Setup](#)
 - [Step 3: Application Dockerization](#)
 - [Step 4: Kubernetes \(EKS\) Setup](#)
 - [Step 5: Deploy to Kubernetes](#)
 - [Step 6: Infrastructure Automation with Terraform](#)
 - [Step 7: Scaling and Monitoring](#)
- [Additional Configuration](#)
 - [CloudFront Setup](#)
 - [Route 53 Domain Management](#)
- [Clean Up Resources](#)
- [Troubleshooting](#)

Prerequisites

- AWS Account with appropriate permissions
- AWS CLI installed and configured
- kubectl installed
- Terraform installed
- Git installed
- Basic knowledge of Docker, Kubernetes, and AWS services

Deployment Steps

Step 1: Clone Repository

```
bash
```

```
# SSH into your EC2 instance
```

```
ssh -i "your-key.pem" ubuntu@<Your-EC2-Public-IP>
```

```
# Install Git (if not installed)
```

```
sudo apt-get update
```

```
sudo apt-get install git
```

```
# Clone this repository
```

```
git clone https://github.com/sadman-tanim/devops-deploy-task.git
```

```
cd devops-deploy-task
```

Step 2: Docker Setup

Install Docker on your EC2 instance:

```
bash
```

```
# Update and install Docker
```

```
sudo apt update
```

```
sudo apt install docker.io
```

```
# Start Docker and enable it on boot
```

```
sudo systemctl start docker
```

```
sudo systemctl enable docker
```

```
# Verify Docker installation
```

```
sudo docker --version
```

```
sudo docker run hello-world
```

If you encounter any issues with Docker installation, try the following steps:

```
bash
```

```
# Add Docker's official GPG key
```

```
curl -fsSL https://download.docker.com/linux/ubuntu/gpg | sudo apt-key add -
```

```
# Add Docker repository
```

```
sudo add-apt-repository "deb [arch=amd64] https://download.docker.com/linux/ubuntu $(lsb_release
```

```
# Update and install Docker CE
```

```
sudo apt-get update
```

```
sudo apt-get install docker-ce
```

Step 3: Application Dockerization

1. Create a Dockerfile in your project directory:

```
Dockerfile
```

```
# Use official Nginx image as a base
```

```
FROM nginx:alpine
```

```
# Copy your application files into the container's Nginx HTML directory
```

```
COPY . /usr/share/nginx/html
```

```
# Expose port 80
```

```
EXPOSE 80
```

```
# Run Nginx in the foreground
```

```
CMD ["nginx", "-g", "daemon off;"]
```

2. Build and run the Docker image:

```
bash
```

```
# Build the Docker image
```

```
sudo docker build -t devops-app .
```

```
# Run the Docker container
```

```
sudo docker run -d -p 80:80 devops-app
```

3. Verify the application by visiting `http://<Your-EC2-Public-IP>` in your browser.

Step 4: Kubernetes (EKS) Setup

Install required tools for managing Kubernetes:

```
bash
```

```
# Install AWS CLI
```

```
curl "https://awscli.amazonaws.com/awscli-exe-linux-x86_64.zip" -o "awscliv2.zip"
```

```
unzip awscliv2.zip
```

```
sudo ./aws/install
```

```
# Configure AWS CLI
```

```
aws configure
```

```
# Install kubectl
```

```
curl -LO "https://storage.googleapis.com/kubernetes-release/release/$(curl -s https://storage.g
```

```
chmod +x ./kubectl
```

```
sudo mv ./kubectl /usr/local/bin/kubectl
```

Create an EKS cluster (via AWS Console or AWS CLI), then:

```
bash
```

```
# Configure kubectl to use the EKS cluster
```

```
aws eks --region <your-region> update-kubeconfig --name <your-cluster-name>
```

```
# Verify connection to the cluster
```

```
kubectl get nodes
```

Step 5: Deploy to Kubernetes

1. Create a deployment.yaml file:

```
yaml
```

```
apiVersion: apps/v1
kind: Deployment
metadata:
  name: devops-app-deployment
spec:
  replicas: 2
  selector:
    matchLabels:
      app: devops-app
  template:
    metadata:
      labels:
        app: devops-app
    spec:
      containers:
        - name: devops-app
          image: devops-app
          ports:
            - containerPort: 80
```

2. Apply the deployment and expose it:

```
bash
```

```
# Apply the deployment
```

```
kubectl apply -f deployment.yaml
```

```
# Expose the deployment via LoadBalancer
```

```
kubectl expose deployment devops-app-deployment --type=LoadBalancer --name=devops-app-service
```

```
# Check the external IP for the service
```

```
kubectl get svc
```

3. Access the application at the LoadBalancer's external IP.

Step 6: Infrastructure Automation with Terraform

1. Install Terraform:

```
bash
```

```
# Download and install Terraform
```

```
curl -LO https://releases.hashicorp.com/terraform/latest_version/terraform_0.14.7_linux_amd64.z
```

```
unzip terraform_0.14.7_linux_amd64.zip
```

```
sudo mv terraform /usr/local/bin/
```

2. Create a main.tf file for provisioning an EKS cluster:

```
hc1
```

```
provider "aws" {  
    region = "us-west-2"  
}
```

```
resource "aws_eks_cluster" "example" {  
    name      = "example-cluster"  
    role_arn = "arn:aws:iam::123456789012:role/eksServiceRole"  
  
    vpc_config {  
        subnet_ids = ["subnet-12345", "subnet-67890"]  
    }  
}
```

```
resource "aws_eks_node_group" "example" {  
    cluster_name = aws_eks_cluster.example.name  
    node_role_arn = "arn:aws:iam::123456789012:role/eksNodeRole"  
    subnet_ids    = ["subnet-12345", "subnet-67890"]  
    scaling_config {  
        desired_size = 2  
        max_size     = 3  
        min_size     = 1  
    }  
}
```

3. Initialize and apply Terraform configuration:

```
bash
```

```
# Initialize Terraform
```

```
terraform init
```

```
# Apply the configuration
```

```
terraform apply
```

4. Set up kubectl for the new cluster:

```
bash
```

```
aws eks --region us-west-2 update-kubeconfig --name example-cluster
```

Step 7: Scaling and Monitoring

Set up auto-scaling for your Kubernetes pods:

```
bash
```

```
# Horizontal Pod Autoscaler
```

```
kubectl autoscale deployment devops-app-deployment --cpu-percent=50 --min=1 --max=5
```

Enable CloudWatch for monitoring:

```
bash
```

```
# Install and start CloudWatch Logs agent
```

```
sudo apt-get install awslogs
```

```
sudo service awslogs start
```

Set up CloudWatch alarms for metrics like CPU usage and memory usage via the AWS Console.

Additional Configuration

CloudFront Setup

For improved content delivery, set up CloudFront:

1. Go to CloudFront → Create Distribution
2. Set the origin to the LoadBalancer URL or EC2 public IP

Route 53 Domain Management

1. Create a Hosted Zone in Route 53 for your domain

2. Set DNS records to point to your LoadBalancer:

```
bash
```

```
aws route53 change-resource-record-sets --hosted-zone-id <zone-id> --change-batch file://records
```

Example records.json:

```
json
```

```
{
  "Changes": [{
    "Action": "UPSERT",
    "ResourceRecordSet": {
      "Name": "yourdomain.com",
      "Type": "A",
      "AliasTarget": {
        "DNSName": "<ELB-DNS-Name>",
        "EvaluateTargetHealth": false,
        "HostedZoneId": "Z3DZXE0EIN2L7G"
      }
    }
  }]
}
```

Clean Up Resources

To avoid unnecessary AWS charges, delete resources when not in use:

```
bash
```

```
# Delete Kubernetes resources
```

```
kubectl delete deployment devops-app-deployment
```

```
kubectl delete svc devops-app-service
```

```
# Destroy Terraform resources
```

```
terraform destroy
```

```
# Terminate EC2 instances if needed
```

```
aws ec2 terminate-instances --instance-ids <instance-id>
```

Troubleshooting

Docker Issues

If you encounter Docker repository issues, try:

```
bash  
  
sudo systemctl daemon-reload  
sudo systemctl restart docker
```

Jenkins Repository Error

If Jenkins installation fails due to repository issues:

```
bash  
  
sudo rm /etc/apt/sources.list.d/jenkins.list  
sudo wget -q -O - https://pkg.jenkins.io/jenkins.io.key | sudo apt-key add -  
sudo sh -c 'echo deb http://pkg.jenkins.io/debian-stable/ / > /etc/apt/sources.list.d/jenkins.l  
sudo apt-get update  
sudo apt-get install jenkins
```

Connection Issues

If you encounter connection issues with repositories:

1. Check your internet connection
2. Try changing Ubuntu mirrors in `/etc/apt/sources.list`
3. Check for proxy issues with `echo $http_proxy`
